

The "Focus Budget" Visualizer

1. Problem Statement Standard time-trackers feel like chores and focus entirely on hours clocked rather than human energy. This results in back-to-back scheduling and digital burnout. The **Focus Budget Visualizer** solves this by gamifying the workday, treating daily mental capacity as a finite budget (100 points) that drains or recharges based on real-time activity.

2. Key Features

- **Dynamic Energy Bar:** A prominent visual gauge starting at 100 points that tracks remaining energy and changes color as levels drop.
- **Active State Selector:** Four real-time toggle buttons that alter the energy drain rate:
 - *Deep Work* (Moderate drain) | *Admin/Email* (Slow drain) | *Meetings* (Heavy drain) | *Rest/Break* (Regenerates energy).
- **Quick Action Overrides:** Instant buttons for real-life events: "**Drink Coffee**" (+15 Energy) and "**Unplanned Emergency**" (-20 Energy).
- **Gamified Streak Tracker:** Awards a "Perfect Balance Badge" and increments a daily streak counter if the user completes the workday without letting their energy hit 0.
- **Interactive Theme Shifter:** The UI background automatically changes color based on the active state (e.g., deep blue for Deep Work, calming green for Breaks). Includes a settings menu to select overall UI styles (*Cyberpunk*, *Sage Oasis*, *Classic Dark*).
- **Daily Analytics:** A clean visual chart at the bottom of the screen summarizing total time spent in each state.

3. Constraints & Boundaries (What it will NOT do)

- **No Accounts or Logins:** No user authentication, passwords, or registration profiles. The app opens instantly.
- **No Cloud Databases:** Data (current streak and theme preference) is saved entirely locally to the browser's localStorage.
- **No Historical Tracking:** The analytics chart focuses strictly on the current day's session; it does not track long-term history or sync across devices.
- **No Heavy Frameworks:** Built purely with single-file web tech (HTML, CSS, vanilla JavaScript) using lightweight CSS transitions for all visual updates.
