

Focus Budget Visualizer: Bug Log

1. Floating Chart Indicator Bug

- **Symptom:** A stray, isolated circular node (a dark grey ball) floats completely outside the right side of the "Energy Trend" chart container.
- **Diagnosis:** The real-time plotting logic calculates SVG coordinates dynamically. An interactive hover point or edge marker (<circle>) was calculated with coordinate bounds extending past the defined SVG viewport width without a parent clip-path or bounding limit.
- **Fix:** Restructured the SVG coordinate mapping function to strictly clamp coordinates inside the graph boundaries and applied overflow: hidden to the SVG's parent container to prevent coordinate overflow from rendering outside the card boundaries.

2. Incorrect Active State Labeling

- **Symptom:** The second active state button was incorrectly labeled as "Admin" instead of "Email", diverging from the updated project requirements.
- **Diagnosis:** The HTML button label and the associated JavaScript state key were hardcoded as admin, causing mismatches with the updated focus-tracking vocabulary.
- **Fix:** Renamed the button display text to "Email" and updated the state dictionary object tracking duration from admin: 0 to email: 0 inside the main script to ensure precise time-allocation calculations.

3. Harsh State Background Color "Snap"

- **Symptom:** When clicking through active states (like transitioning from *Deep Work* to *Rest / Break*), the background colors snapped instantly with a harsh visual jump rather than a smooth mood shift.
- **Diagnosis:** The background-color changes were applied programmatically via instant class-swapping in JavaScript without any CSS transition properties linked to the page's root/body elements.
- **Fix:** Added global Tailwind transition classes (transition-all duration-700 ease-in-out) to the main layout wrapper and adjusted the background handler in the JavaScript to smoothly interpolate the color values over 700ms for an immersive state shift.
